Cooling and Freezing of Boar Spermatozoa: Supplementation of the Freezing Media With Reduced Glutathione Preserves Sperm Function / J. Gadea, F. García-Vazquez, C. Matás, J. C. Gardón, S. Cánovas, D. Gumbao	396
Intramuscular Testosterone Enanthate Plus Very Low Dosage Oral Levonorgestrel Suppresses Spermatogenesis Without Causing Weight Gain in Normal Young Men: A Randomized Clinical Trial / B. D. Anawalt, J. K. Amory, K. L. Herbst, A. D. Coviello, S. T. Page, W. J. Bremner, A. M. Matsumoto	405
Biological Activity Assessment of a Novel Contraceptive Antimicrobial Agent / A. Garg, R. A. Anderson, L. J. D. Zaneveld, S. Garg	414
Cell Growth Effects of Triiodothyronine and Expression of Thyroid Hormone Receptor in Prostate Carcinoma Cells / M.-L. Hsieh, H.-H. Juang	422
Idiopathic Infertility: Effect of Palmitoylethanolamide (a Homologue of Anandamide) on Hyperactivated Sperm Cell Motility and Ca²⁺ Influx / A. Ambrosini, G. Zolese, S. Ambrosi, E. Bertoli, F. Mantero, M. Boscaro, G. Balercia	429

Cover: *Intramuscular testosterone (T) enanthate plus very low dosage oral levonorgestrel (LNG) regimens suppressed spermatogenesis rapidly ($P < .05$ by 4 weeks compared with baseline). There were no differences in rapidity or completeness of spermatogenic suppression between the T + LNG 31 ($n = 20$) and T + LNG 62 ($n = 21$) groups. Inset depicts sperm concentrations during the last 12 weeks of treatment; a different scale is used for the ordinate (0–5 million/mL) to clearly depict the absolute concentrations when sperm concentrations are very low during the last half of the treatment period. See article by Anawalt et al on page 405.*
